CHAPTER 1

Full file at https://TestbankDirect.eu/

PROBLEM 1.1

Two solid cylindrical rods AB and BC are welded together at B and loaded as shown. Knowing that $d_1 = 30$ mm and $d_2 = 50$ mm, find the average normal stress at the midsection of (a) rod AB, (b) rod BC.

SOLUTION

(<i>a</i>)	Rod <i>AB</i> :		
	Force:	$P = 60 \times 10^3 \mathrm{N}$ tension	
	Area:	$A = \frac{\pi}{4}d_1^2 = \frac{\pi}{4}(30 \times 10^{-3})^2 = 706.86 \times 10^{-6} \mathrm{m}^2$	
	Normal stress:	$\sigma_{AB} = \frac{P}{A} = \frac{60 \times 10^3}{706.86 \times 10^{-6}} = 84.882 \times 10^6 \mathrm{Pa}$	$\sigma_{AB} = 84.9 \text{ MPa} \blacktriangleleft$
(<i>b</i>)	Rod <i>BC</i> :		
	Force:	$P = 60 \times 10^3 - (2)(125 \times 10^3) = -190 \times 10^3 \text{ N}$	
	Area:	$A = \frac{\pi}{4}d_2^2 = \frac{\pi}{4}(50 \times 10^{-3})^2 = 1.96350 \times 10^{-3} \mathrm{m}^2$	
	Normal stress:	$\sigma_{BC} = \frac{P}{A} = \frac{-190 \times 10^3}{1.96350 \times 10^{-3}} = -96.766 \times 10^6 \mathrm{Pa}$	
			σ_{BC} = -96.8 MPa <

PROBLEM 1.2

Two solid cylindrical rods AB and BC are welded together at B and loaded as shown. Knowing that the average normal stress must not exceed 150 MPa in either rod, determine the smallest allowable values of the diameters d_1 and d_2 .

SOL			
<i>(a)</i>	Rod AB:		
	Force:	$P = 60 \times 10^3 \mathrm{N}$	
	Stress:	$\sigma_{AB} = 150 \times 10^6 \mathrm{Pa}$	
	Area:	$A = \frac{\pi}{4}d_1^2$	
		$\sigma_{AB} = \frac{P}{A} \therefore A = \frac{P}{\sigma_{AB}}$	
		$\frac{\pi}{4}d_1^2 = \frac{P}{\sigma_{AB}}$	
		$d_1^2 = \frac{4P}{\pi\sigma_{AB}} = \frac{(4)(60 \times 10^3)}{\pi(150 \times 10^6)} = 509.30 \times 10^{-6} \mathrm{m}^2$	
		$d_1 = 22.568 \times 10^{-3} \mathrm{m}$	$d_1 = 22.6 \text{ mm} \blacktriangleleft$
<i>(b)</i>	Rod <i>BC</i> :		
	Force:	$P = 60 \times 10^3 - (2)(125 \times 10^3) = -190 \times 10^3 \mathrm{N}$	
	Stress:	$\sigma_{BC} = -150 \times 10^6 \mathrm{Pa}$	
	Area:	$A = \frac{\pi}{4}d_2^2$	
		$\sigma_{BC} = \frac{P}{A} = \frac{4P}{\pi d_2^2}$	
		$d_2^2 = \frac{4P}{\pi\sigma_{BC}} = \frac{(4)(-190 \times 10^3)}{\pi(-150 \times 10^6)} = 1.61277 \times 10^{-3} \mathrm{m}^2$	
		$d_2 = 40.159 \times 10^{-3} \mathrm{m}$	$d_2 = 40.2 \text{ mm} \blacktriangleleft$

4

Full file at https://TestbankDirect.eu/

SOLUTION

(<i>a</i>)	Rod <i>AB</i> :		
		P = 12 + 10 = 22 kips	
		$A = \frac{\pi}{4}d_1^2 = \frac{\pi}{4}(1.25)^2 = 1.22718 \text{ in}^2$	
		$\sigma_{AB} = \frac{P}{A} = \frac{22}{1.22718} = 17.927 \text{ ksi}$	$\sigma_{AB} = 17.93 \text{ ksi} \blacktriangleleft$
(<i>b</i>)	Rod BC:		
		P = 10 kips	
		$A = \frac{\pi}{4}d_2^2 = \frac{\pi}{4}(0.75)^2 = 0.44179 \text{ in}^2$	
		$\sigma_{AB} = \frac{P}{A} = \frac{10}{0.44179} = 22.635 \text{ ksi}$	$\sigma_{AB} = 22.6 \text{ ksi} \blacktriangleleft$

PROBLEM 1.4

Two solid cylindrical rods AB and BC are welded together at B and loaded as shown. Determine the magnitude of the force **P** for which the tensile stresses in rods AB and BC are equal.

SOLUTION Rod AB: *(a)* P = P + 12 kips $A = \frac{\pi d^2}{4} = \frac{\pi}{4} (1.25 \text{ in.})^2$ $A = 1.22718 \text{ in}^2$ $\sigma_{AB} = \frac{P + 12 \text{ kips}}{1.22718 \text{ in}^2}$ Rod BC: *(b)* P = P $A = \frac{\pi}{4}d^2 = \frac{\pi}{4}(0.75 \text{ in.})^2$ $A = 0.44179 \text{ in}^2$ $\sigma_{BC} = \frac{P}{0.44179 \text{ in}^2}$ $\sigma_{AB} = \sigma_{BC}$ $\frac{P+12 \text{ kips}}{1.22718 \text{ in}^2} = \frac{P}{0.44179 \text{ in}^2}$ 5.3015 = 0.78539PP = 6.75 kips

A 1200 N

PROBLEM 1.5

A strain gage located at C on the surface of bone AB indicates that the average normal stress in the bone is 3.80 MPa when the bone is subjected to two 1200-N forces as shown. Assuming the cross section of the bone at C to be annular and knowing that its outer diameter is 25 mm, determine the inner diameter of the bone's cross section at C.

SOLUTION $\sigma = \frac{P}{A} \quad \therefore \quad A = \frac{P}{\sigma}$ Geometry: $A = \frac{\pi}{4}(d_1^2 - d_2^2)$ $d_2^2 = d_1^2 - \frac{4A}{\pi} = d_1^2 - \frac{4P}{\pi\sigma}$ $d_2^2 = (25 \times 10^{-3})^2 - \frac{(4)(1200)}{\pi(3.80 \times 10^6)}$ $= 222.92 \times 10^{-6} \text{ m}^2$ $d_2 = 14.93 \times 10^{-3} \text{ m}$ $d_2 = 14.93 \text{ mm} \blacktriangleleft$

PROPRIETARY MATERIAL. Copyright © 2015 McGraw-Hill Education. This is proprietary material solely for authorized instructor use. Not authorized for sale or distribution in any manner. PROBLEM 1.6

Two brass rods *AB* and *BC*, each of uniform diameter, will be brazed together at *B* to form a nonuniform rod of total length 100 m, which will be suspended from a support at *A* as shown. Knowing that the density of brass is 8470 kg/m^3 , determine (*a*) the length of rod *AB* for which the maximum normal stress in *ABC* is minimum, (*b*) the corresponding value of the maximum normal stress.

SOLUTION		
Areas:	$A_{AB} = \frac{\pi}{4} (15 \text{ mm})^2 = 176.715 \text{ mm}^2 = 176.715 \times 10^{-6} \text{m}^2$	
	$A_{BC} = \frac{\pi}{4} (10 \text{ mm})^2 = 78.54 \text{ mm}^2 = 78.54 \times 10^{-6} \text{m}^2$	
From geometry,	b = 100 - a	
Weights:	$W_{AB} = \rho g A_{AB} \ell_{AB} = (8470)(9.81)(176.715 \times 10^{-6})a = 14.683a$	l
	$W_{BC} = \rho g A_{BC} \ell_{BC} = (8470)(9.81)(78.54 \times 10^{-6})(100 - a) = 65$	52.59 – 6.526 <i>a</i>
Normal stresses:		
At A,	$P_A = W_{AB} + W_{BC} = 652.59 + 8.157a$	(1)
	$\sigma_A = \frac{P_A}{A_{AB}} = 3.6930 \times 10^6 + 46.160 \times 10^3 a$	
At <i>B</i> ,	$P_B = W_{BC} = 652.59 - 6.526a$	(2)
	$\sigma_B = \frac{P_B}{A_{BC}} = 8.3090 \times 10^6 - 83.090 \times 10^3 a$	
(a) Length of re	$\frac{d AB}{d B}$. The maximum stress in ABC is minimum when $\sigma_A = \sigma_B$	₃ or
	$4.6160 \times 10^6 - 129.25 \times 10^3 a = 0$	
	$a = 35.71 \mathrm{m}$	$\ell_{AB} = a = 35.7 \mathrm{m}$
(b) <u>Maximum normal stress</u> .		
	$\sigma_A = 3.6930 \times 10^6 + (46.160 \times 10^3)(35.71)$	
	$\sigma_B = 8.3090 \times 10^6 - (83.090 \times 10^3)(35.71)$	
	$\sigma_A = \sigma_B = 5.34 \times 10^6 \text{ Pa}$	σ = 5.34 MPa \triangleleft

PROBLEM 1.14

Two hydraulic cylinders are used to control the position of the robotic arm ABC. Knowing that the control rods attached at A and D each have a 20-mm diameter and happen to be parallel in the position shown, determine the average normal stress in (a) member AE, (b) member DG.

SOLUTION

Use member ABC as free body.

+)
$$\Sigma M_B = 0$$
: $(0.150) \frac{4}{5} F_{AE} - (0.600)(800) = 0$
 $F_{AE} = 4 \times 10^3 \text{ N}$

$$F_{AE} = 4 \times 10^3 \,\mathrm{N}$$

Area of rod in member AE is $A = \frac{\pi}{4}d^2 = \frac{\pi}{4}(20 \times 10^{-3})^2 = 314.16 \times 10^{-6} \text{m}^2$ $\sigma_{AE} = \frac{F_{AE}}{A} = \frac{4 \times 10^3}{314.16 \times 10^{-6}} = 12.7324 \times 10^6 \,\mathrm{Pa}$ Stress in rod AE:

(a)
$$\sigma_{AE} = 12.73 \text{ MPa} \blacktriangleleft$$

Use combined members ABC and BFD as free body.

$$F_{DG} = -1500 \text{ N}$$
Area of rod DG:

$$A = \frac{\pi}{4}d^2 = \frac{\pi}{4}(20 \times 10^{-3})^2 = 314.16 \times 10^{-6} \text{ m}^2$$
Stress in rod DG:

$$\sigma_{DG} = \frac{F_{DG}}{A} = \frac{-1500}{3.1416 \times 10^{-6}} = -4.7746 \times 10^6 \text{ Pa}$$
(b)

$$\sigma_{DG} = -4.77 \text{ MPa} \blacktriangleleft$$

16

Full file at https://TestbankDirect.eu/

PROBLEM 1.15

Determine the diameter of the largest circular hole that can be punched into a sheet of polystyrene 6 mm thick, knowing that the force exerted by the punch is 45 kN and that a 55-MPa average shearing stress is required to cause the material to fail.

SOLUTION

For cylindrical failure surface:	$A = \pi dt$	
Shearing stress:	$ au = \frac{P}{A}$ or $A = \frac{P}{\tau}$	
Therefore,	$\frac{P}{\tau} = \pi dt$	
Finally,	$d = \frac{P}{\pi t \tau}$	
	$=\frac{45\times10^3\mathrm{N}}{\pi(0.006\mathrm{m})(55\times10^6\mathrm{Pa})}$	
	$= 43.406 \times 10^{-3} \mathrm{m}$	
		d

= 43.4 mm <

Full file at https://TestbankDirect.eu/

PROBLEM 1.16

Two wooden planks, each $\frac{1}{2}$ in. thick and 9 in. wide, are joined by the dry mortise joint shown. Knowing that the wood used shears off along its grain when the average shearing stress reaches 1.20 ksi, determine the magnitude *P* of the axial load that will cause the joint to fail.

P = 2.25 kips ◀

SOLUTION

Six areas must be sheared off when the joint fails. Each of these areas has dimensions $\frac{5}{8}$ in. $\times \frac{1}{2}$ in., its area being

$$A = \frac{5}{8} \times \frac{1}{2} = \frac{5}{16}$$
 in² = 0.3125 in²

At failure, the force carried by each area is

$$F = \tau A = (1.20 \text{ ksi})(0.3125 \text{ in}^2) = 0.375 \text{ kips}$$

Since there are six failure areas,

$$P = 6F = (6)(0.375)$$

PROPRIETARY MATERIAL. Copyright © 2015 McGraw-Hill Education. This is proprietary material solely for authorized instructor use

Full file at https://TestbankDirect.eu/

PROBLEM 1.17

When the force \mathbf{P} reached 1600 lb, the wooden specimen shown failed in shear along the surface indicated by the dashed line. Determine the average shearing stress along that surface at the time of failure.

SOLUTION		
Area being sheared:	$A = 3 \text{ in.} \times 0.6 \text{ in.} = 1.8 \text{ in}^2$	
Force:	P = 1600 lb	
Shearing stress:	$\tau = \frac{P}{A} - \frac{1600 \text{ lb}}{1.8 \text{ in}^2} = 8.8889 \times 10^2 \text{ psi}$	$\tau = 889 \text{ psi} \blacktriangleleft$

PROPRIETARY MATERIAL. Copyright © 2015 McGraw-Hill Education. This is proprietary material solely for authorized instructor use. Not authorized for sale or distribution in any manner. This document may not be copied, scanned, duplicated, forwarded, distributed, or posted on a website, in whole or part.

Full file at https://TestbankDirect.eu/

PROBLEM 1.18

A load **P** is applied to a steel rod supported as shown by an aluminum plate into which a 12-mm-diameter hole has been drilled. Knowing that the shearing stress must not exceed 180 MPa in the steel rod and 70 MPa in the aluminum plate, determine the largest load P that can be applied to the rod.

SOLUTION

F

For steel:

$$A_{1} = \pi dt = \pi (0.012 \text{ m})(0.010 \text{ m})$$

$$= 376.99 \times 10^{-6} \text{ m}^{2}$$

$$\tau_{1} = \frac{P}{A} \therefore P = A_{1}\tau_{1} = (376.99 \times 10^{-6} \text{ m}^{2})(180 \times 10^{6} \text{ Pa})$$

$$= 67.858 \times 10^{3} \text{ N}$$
For aluminum:

$$A_{2} = \pi dt = \pi (0.040 \text{ m})(0.008 \text{ m}) = 1.00531 \times 10^{-3} \text{ m}^{2}$$

$$\tau_{2} = \frac{P}{A_{2}} \therefore P = A_{2}\tau_{2} = (1.00531 \times 10^{-3} \text{ m}^{2})(70 \times 10^{6} \text{ Pa}) = 70.372 \times 10^{3} \text{ N}$$
Limiting value of P is the smaller value, so

$$P = 67.9 \text{ kN} \blacktriangleleft$$

.

PROBLEM 1.20

Three wooden planks are fastened together by a series of bolts to form a column. The diameter of each bolt is 12 mm and the inner diameter of each washer is 16 mm, which is slightly larger than the diameter of the holes in the planks. Determine the smallest allowable outer diameter d of the washers, knowing that the average normal stress in the bolts is 36 MPa and that the bearing stress between the washers and the planks must not exceed 8.5 MPa.

SOLUTION		
Bolt:	$A_{\text{Bolt}} = \frac{\pi d^2}{4} = \frac{\pi (0.012 \text{ m})^2}{4} = 1.13097 \times 10^{-4} \text{ m}^2$	
Tensile force in bolt:	$\sigma = \frac{P}{A} \implies P = \sigma A$	
	$= (36 \times 10^6 \mathrm{Pa})(1.13097 \times 10^{-4} \mathrm{m^2})$	
	$= 4.0715 \times 10^3 \mathrm{N}$	
Bearing area for washer:	$A_{\scriptscriptstyle W}=rac{\pi}{4}ig(d_o^2-d_i^2ig)$	
and	$A_w = rac{P}{\sigma_{BRG}}$	
Therefore, equating the tw	vo expressions for A_w gives	
	$rac{\pi}{4} \Big(d_o^2 - d_i^2 \Big) = rac{P}{\sigma_{BRG}}$	
	$d_o^2 = \frac{4P}{\pi\sigma_{BRG}} + d_i^2$	
	$d_o^2 = \frac{4}{\pi} \frac{(4.0715 \times 10^3 \text{ N})}{(8.5 \times 10^6 \text{ Pa})} + (0.016 \text{ m})^2$	
	$d_o^2 = 8.6588 \times 10^{-4} \mathrm{m}^2$	
	$d_o = 29.426 \times 10^{-3} \mathrm{m}$	
		$d_o = 29.4 \text{ mm}$

PROPRIETARY MATERIAL. Copyright © 2015 McGraw-Hill Education. This is proprietary material solely for authorized instructor use. Not authorized for sale or distribution in any manner. Full file at https://TestbankDirect.eu/

PROBLEM 1.21

A 40-kN axial load is applied to a short wooden post that is supported by a concrete footing resting on undisturbed soil. Determine (*a*) the maximum bearing stress on the concrete footing, (*b*) the size of the footing for which the average bearing stress in the soil is 145 kPa.

SOLUTION

(a) Bearing stress on concrete footing.

$$P = 40 \text{ kN} = 40 \times 10^{3} \text{ N}$$

$$A = (100)(120) = 12 \times 10^{3} \text{ mm}^{2} = 12 \times 10^{-3} \text{ m}^{2}$$

$$\sigma = \frac{P}{A} = \frac{40 \times 10^{3}}{12 \times 10^{-3}} = 3.3333 \times 10^{6} \text{ Pa}$$

$$3.33 \text{ MPa} \blacktriangleleft$$

$$P = 40 \times 10^{3} \text{ N} \qquad \sigma = 145 \text{ kPa} = 45 \times 10^{3} \text{ Pa}$$

(b) Footing area.
$$P = 40 \times 10^3 \text{ N}$$
 $\sigma = 145 \text{ kPa} = 45 \times 10^3 \text{ Pa}$

$$\sigma = \frac{P}{A}$$
 $A = \frac{P}{\sigma} = \frac{40 \times 10^3}{145 \times 10^3} = 0.27586 \text{ m}^2$

Since the area is square, $A = b^2$

$$b = \sqrt{A} = \sqrt{0.27586} = 0.525 \text{ m}$$
 $b = 525 \text{ mm}$

PROBLEM 1.22

An axial load **P** is supported by a short W8 × 40 column of crosssectional area A = 11.7 in² and is distributed to a concrete foundation by a square plate as shown. Knowing that the average normal stress in the column must not exceed 30 ksi and that the bearing stress on the concrete foundation must not exceed 3.0 ksi, determine the side *a* of the plate that will provide the most economical and safe design.

SOLUTION For the column, $\sigma = \frac{P}{A}$ or $P = \sigma A = (30)(11.7) = 351$ kips For the $a \times a$ plate, $\sigma = 3.0$ ksi $A = \frac{P}{\sigma} = \frac{351}{3.0} = 117$ in² Since the plate is square, $A = a^2$ $a = \sqrt{A} = \sqrt{117}$ a = 10.82 in.

PROBLEM 1.23

Link AB, of width b = 2 in. and thickness $t = \frac{1}{4}$ in., is used to support the end of a horizontal beam. Knowing that the average normal stress in the link is -20 ksi and that the average shearing stress in each of the two pins is 12 ksi, determine (a) the diameter d of the pins, (b) the average bearing stress in the link.

SOLUTION

Rod *AB* is in compression.

$$A = bt$$
 where $b = 2$ in. and $t = \frac{1}{4}$ in.
 $P = -\sigma A = -(-20)(2)\left(\frac{1}{4}\right) = 10$ kips

Pin:

and

Pin:
$$\tau_P = \frac{P}{A_P}$$

and $A_P = \frac{\pi}{4}d^2$
(a) $d = \sqrt{\frac{4A_P}{\pi}} = \sqrt{\frac{4P}{\pi\tau_P}} = \sqrt{\frac{(4)(10)}{\pi(12)}} = 1.03006$ in.

(b)
$$\sigma_b = \frac{P}{dt} = \frac{10}{(1.03006)(0.25)} = 38.833 \text{ ksi}$$

d = 1.030 in.

 σ_b = 38.8 ksi \blacktriangleleft

PROBLEM 1.25 (Continued)

 (a) Allowable pin diameter.

$$\tau = \frac{F_{AB}}{2A_P} = \frac{F_{AB}}{2\frac{\pi}{4}d^2} = \frac{2F_{AB}}{\pi d^2}$$
 where $F_{AB} = 24.727 \times 10^3$ N

 $d^2 = \frac{2F_{AB}}{\pi \tau} = \frac{(2)(24.727 \times 10^3)}{\pi (120 \times 10^6)} = 131.181 \times 10^{-6} \text{ m}^2$
 $d = 11.4534 \times 10^{-3} \text{ m}$

 (b) Bearing stress in AB at A.

 $A_b = td = (0.016)(11.4534 \times 10^{-3}) = 183.254 \times 10^{-6} \text{ m}^2$
 $\sigma_b = \frac{F_{AB}}{A_b} = \frac{24.727 \times 10^3}{183.254 \times 10^{-6}} = 134.933 \times 10^6 \text{ Pa}$

 134.9 MPa

 (c) Bearing stress in support brackets at B.

 $A = td = (0.012)(11.4534 \times 10^{-3}) = 137.441 \times 10^{-6} \text{ m}^2$
 $\sigma_b = \frac{\frac{1}{2}F_{AB}}{A} = \frac{(0.5)(24.727 \times 10^3)}{137.441 \times 10^{-6}} = 89.955 \times 10^6 \text{ Pa}$

 90.0 MPa

PROBLEM 1.29

Two wooden members of uniform rectangular cross section are joined by the simple glued scarf splice shown. Knowing that P = 11 kN, determine the normal and shearing stresses in the glued splice.

SOLUTION

$$\theta = 90^{\circ} - 45^{\circ} = 45^{\circ}$$

$$P = 11 \text{ kN} = 11 \times 10^{3} \text{ N}$$

$$A_{0} = (150)(75) = 11.25 \times 10^{3} \text{ mm}^{2} = 11.25 \times 10^{-3} \text{ m}^{2}$$

$$\sigma = \frac{P \cos^{2} \theta}{A_{0}} = \frac{(11 \times 10^{3}) \cos^{2} 45^{\circ}}{11.25 \times 10^{-3}} = 489 \times 10^{3} \text{ Pa}$$

$$\sigma = 489 \text{ kPa} \blacktriangleleft$$

$$\tau = \frac{P \sin 2\theta}{2A_{0}} = \frac{(11 \times 10^{3})(\sin 90^{\circ})}{(2)(11.25 \times 10^{-3})} = 489 \times 10^{3} \text{ Pa}$$

$$\tau = 489 \text{ kPa} \blacktriangleleft$$

PROBLEM 1.30

Two wooden members of uniform rectangular cross section are joined by the simple glued scarf splice shown. Knowing that the maximum allowable shearing stress in the glued splice is 620 kPa, determine (*a*) the largest load **P** that can be safely applied, (*b*) the corresponding tensile stress in the splice.

SOLUTION

$$\begin{array}{l}
\theta = 90^{\circ} - 45^{\circ} = 45^{\circ} \\
A_{0} = (150)(75) = 11.25 \times 10^{3} \text{mm}^{2} = 11.25 \times 10^{-3} \text{m}^{2} \\
\tau = 620 \text{ kPa} = 620 \times 10^{3} \text{ Pa} \\
\tau = \frac{P \sin 2\theta}{2A_{0}} \\
\end{array}$$
(a)
$$\begin{array}{l}
P = \frac{2A_{0}\tau}{\sin 2\theta} = \frac{(2)(11.25 \times 10^{-3})(620 \times 10^{3})}{\sin 90^{\circ}} \\
= 13.95 \times 10^{3} \text{ N} \\
\end{array}$$
P = 13.95 kN
(b)
$$\sigma = \frac{P \cos^{2} \theta}{A_{0}} = \frac{(13.95 \times 10^{3})(\cos 45^{\circ})^{2}}{11.25 \times 10^{-3}} \\
= 620 \times 10^{3} \text{ Pa} \\
\end{array}$$

$$\sigma = 620 \text{ kPa} \blacktriangleleft$$

SOL	UTION	
	$A_0 = (6)(6) = 36 \text{ in}^2$	
	$ au_{ m max} = 2.5 \ m ksi$	
	$\theta = 45^{\circ}$ for plane of $\tau_{\rm max}$	
(<i>a</i>)	$\tau_{\max} = \frac{ P }{2A_0}$ \therefore $ P = 2A_0 \tau_{\max} = (2)(36)(2.5)$	<i>P</i> = 180.0 kips ◀
<i>(b)</i>	$\sin 2\theta = 1 2\theta = 90^{\circ}$	$\theta = 45.0^{\circ} \blacktriangleleft$
(c)	$\sigma_{45} = \frac{P}{A_0} \cos^2 45^\circ = \frac{P}{2A_0} = -\frac{180}{(2)(36)}$	σ_{45} = -2.50 ksi <
(<i>d</i>)	$\sigma_{\max} = \frac{P}{A_0} = \frac{-180}{36}$	$\sigma_{\rm max}$ = -5.00 ksi <

Full file at https://TestbankDirect.eu/

6 in

р

PROBLEM 1.34

A 240-kip load **P** is applied to the granite block shown. Determine the resulting maximum value of (a) the normal stress, (b) the shearing stress. Specify the orientation of the plane on which each of these maximum values occurs.

SOLUTION

$$A_{0} = (6)(6) = 36 \text{ in}^{2}$$

$$\sigma = \frac{P}{A_{0}} \cos^{2} \theta = \frac{-240}{36} \cos^{2} \theta = -6.67 \cos^{2} \theta$$
(a) max tensile stress = 0 at $\theta = 90.0^{\circ}$
max. compressive stress = 6.67 ksi at $\theta = 0^{\circ}$
(b) $\tau_{\max} = \frac{P}{2A_{0}} = \frac{240}{(2)(36)}$

$$\tau_{\max} = 3.33 \text{ ksi} \blacktriangleleft$$
at $\theta = 45^{\circ}$

PROBLEM 1.35

A steel pipe of 400-mm outer diameter is fabricated from 10-mm thick plate by welding along a helix that forms an angle of 20° with a plane perpendicular to the axis of the pipe. Knowing that a 300-kN axial force **P** is applied to the pipe, determine the normal and shearing stresses in directions respectively normal and tangential to the weld.

SOLUTION

$$d_{o} = 0.400 \text{ m}$$

$$r_{o} = \frac{1}{2}d_{o} = 0.200 \text{ m}$$

$$r_{i} = r_{o} - t = 0.200 - 0.010 = 0.190 \text{ m}$$

$$A_{o} = \pi(r_{o}^{2} - r_{i}^{2}) = \pi(0.200^{2} - 0.190^{2})$$

$$= 12.2522 \times 10^{-3} \text{ m}^{2}$$

$$\theta = 20^{\circ}$$

$$\sigma = \frac{P}{A_{o}} = \cos^{2}\theta = \frac{-300 \times 10^{3} \cos^{2} 20^{\circ}}{12.2522 \times 10^{-3}} = 21.621 \times 10^{6} \text{ Pa}$$

$$\sigma = -21.6 \text{ MPa} \blacktriangleleft$$

$$\tau = \frac{P}{2A_{0}} = \sin 2\theta = \frac{-300 \times 10^{3} \sin 40^{\circ}}{(2)(12.2522 \times 10^{-3})} = 7.8695 \times 10^{6} \text{ Pa}$$

$$\tau = 7.87 \text{ MPa} \blacktriangleleft$$

Full file at https://TestbankDirect.eu/

PROBLEM 1.36

A steel pipe of 400-mm outer diameter is fabricated from 10-mm thick plate by welding along a helix that forms an angle of 20° with a plane perpendicular to the axis of the pipe. Knowing that the maximum allowable normal and shearing stresses in the directions respectively normal and tangential to the weld are $\sigma = 60$ MPa and $\tau = 36$ MPa, determine the magnitude *P* of the largest axial force that can be applied to the pipe.

SOLUTION		
	$d_o = 0.400 \text{ m}$	
	$r_o = \frac{1}{2}d_o = 0.200 \text{ m}$	
	$r_i^2 = r_o - t = 0.200 - 0.010 = 0.190 \text{ m}$	
	$A_o = \pi (r_o^2 - r_i^2) = \pi (0.200^2 - 0.190^2)$	
	$= 12.2522 \times 10^{-3} \mathrm{m}^2$	
	$\theta = 20^{\circ}$	
Based on	$ \sigma = 60$ MPa: $\sigma = \frac{P}{A_0} \cos^2 \theta$	
	$P = \frac{A_o \sigma}{\cos^2 \theta} = \frac{(12.2522 \times 10^{-3})(60 \times 10^6)}{\cos^2 20^\circ} = 832.52 \times 10^3 \mathrm{N}$	
Based on	$ \tau = 30$ MPa: $\tau = \frac{P}{2A_o} \sin 2\theta$	
	$P = \frac{2A_o\tau}{\sin 2\theta} = \frac{(2)(12.2522 \times 10^{-3})(36 \times 10^6)}{\sin 40^\circ} = 1372.39 \times 10^3 \mathrm{N}$	1
Smaller value is the allowa	ble value of <i>P</i> .	$P = 833 \text{ kN} \blacktriangleleft$

PROBLEM 1.43

Two wooden members are joined by plywood splice plates that are fully glued on the contact surfaces. Knowing that the clearance between the ends of the members is 6 mm and that the ultimate shearing stress in the glued joint is 2.5 MPa, determine the length L for which the factor of safety is 2.75 for the loading shown.

SOLUTION

$$\tau_{\rm all} = \frac{2.5 \text{ MPa}}{2.75} = 0.90909 \text{ MPa}$$

On one face of the upper contact surface,

$$A = \frac{L - 0.006 \text{ m}}{2} (0.125 \text{ m})$$

Since there are 2 contact surfaces,

$$\tau_{all} = \frac{P}{2A}$$

0.90909 × 10⁶ = $\frac{16 \times 10^3}{(L - 0.006)(0.125)}$
 $L = 0.14680 \text{ m}$

146.8 mm **<**

Full file at https://TestbankDirect.eu/

PROBLEM 1.44

For the joint and loading of Prob. 1.43, determine the factor of safety when L = 180 mm.

PROBLEM 1.43 Two wooden members are joined by plywood splice plates that are fully glued on the contact surfaces. Knowing that the clearance between the ends of the members is 6 mm and that the ultimate shearing stress in the glued joint is 2.5 MPa, determine the length L for which the factor of safety is 2.75 for the loading shown.

SOLUTION

Area of one face of upper contact surface:

$$A = \frac{0.180 \text{ m} - 0.006 \text{ m}}{2} (0.125 \text{ m})$$
$$A = 10.8750 \times 10^{-3} \text{ m}^{2}$$

Since there are two surfaces,

$$\tau_{\text{all}} = \frac{P}{2A} = \frac{16 \times 10^3 \text{ N}}{2(10.8750 \times 10^{-3} \text{ m}^2)}$$

$$\tau_{\text{all}} = 0.73563 \text{ MPa}$$

F.S. = $\frac{\tau_u}{\tau_{\text{all}}} = \frac{2.5 \text{ MPa}}{0.73563 \text{ MPa}} = 3.40$

PROBLEM 1.45

Three $\frac{3}{4}$ -in.-diameter steel bolts are to be used to attach the steel plate shown to a wooden beam. Knowing that the plate will support a load P = 24 kips and that the ultimate shearing stress for the steel used is 52 ksi, determine the factor of safety for this design.

SOLUTION

For each bolt,	$A = \frac{\pi}{4}d^2 = \frac{\pi}{4}\left(\frac{3}{4}\right)^2 = 0.44179 \text{ in}^2$ $P_U = A\tau_U = (0.44179)(52)$ $= 22.973 \text{ kips}$	
For the three bolts,	$P_U = (3)(22.973) = 68.919$ kips	
Factor of safety:		
	$F.S. = \frac{P_U}{P} = \frac{68.919}{24}$	<i>F.S.</i> = 2.87 ◀

Full file at https://TestbankDirect.eu/

PROBLEM 1.46

Three steel bolts are to be used to attach the steel plate shown to a wooden beam. Knowing that the plate will support a load P = 28 kips, that the ultimate shearing stress for the steel used is 52 ksi, and that a factor of safety of 3.25 is desired, determine the required diameter of the bolts.

SOLUTION

For each bolt,

 $P = \frac{24}{3} = 8$ kips

Required:

 $P_U = (F.S.)P = (3.25)(8.0) = 26.0$ kips

$$\tau_U = \frac{P_U}{A} = \frac{P_U}{\frac{\pi}{4}d^2} = \frac{4P_U}{\pi d^2}$$
$$d = \sqrt{\frac{4P_U}{\pi \tau_U}} = \sqrt{\frac{(4)(26.0)}{\pi (52)}} = 0.79789 \text{ in.} \qquad d = 0.798$$

in. ◀

PROBLEM 1.47

A load **P** is supported as shown by a steel pin that has been inserted in a short wooden member hanging from the ceiling. The ultimate strength of the wood used is 60 MPa in tension and 7.5 MPa in shear, while the ultimate strength of the steel is 145 MPa in shear. Knowing that b = 40 mm, c = 55 mm, and d = 12 mm, determine the load **P** if an overall factor of safety of 3.2 is desired.

SOLUTION

Based on double shear in pin,

$$P_U = 2A\tau_U = 2\frac{\pi}{4}d^2\tau_U$$
$$= \frac{\pi}{4}(2)(0.012)^2(145 \times 10^6) = 32.80 \times 10^3 \text{ N}$$

Based on tension in wood,

$$P_U = A\sigma_U = w(b - d)\sigma_U$$

= (0.040)(0.040 - 0.012)(60 × 10⁶)
= 67.2 × 10³ N

Based on double shear in the wood,

$$P_U = 2A\tau_U = 2wc\tau_U = (2)(0.040)(0.055)(7.5 \times 10^6)$$

= 33.0 × 10³ N
Use smallest $P_U = 32.8 \times 10^3$ N
Allowable: $P = \frac{P_U}{F.S.} = \frac{32.8 \times 10^3}{3.2} = 10.25 \times 10^3$ N 10.25 kN

Full file at https://TestbankDirect.eu/

PROBLEM 1.48

For the support of Prob. 1.47, knowing that the diameter of the pin is d = 16 mm and that the magnitude of the load is P = 20 kN, determine (*a*) the factor of safety for the pin, (*b*) the required values of *b* and *c* if the factor of safety for the wooden members is the same as that found in part *a* for the pin.

PROBLEM 1.47 A load **P** is supported as shown by a steel pin that has been inserted in a short wooden member hanging from the ceiling. The ultimate strength of the wood used is 60 MPa in tension and 7.5 MPa in shear, while the ultimate strength of the steel is 145 MPa in shear. Knowing that b = 40 mm, c = 55 mm, and d = 12 mm, determine the load **P** if an overall factor of safety of 3.2 is desired.

SOLUTION

$$P = 20 \text{ kN} = 20 \times 10^{3} \text{ N}$$
(a) Pin:

$$A = \frac{\pi}{4}d^{2} = \frac{\pi}{4}(0.016)^{2} = 2.01.06 \times 10^{-6} \text{ m}^{2}$$
Double shear:

$$\tau = \frac{P}{2A} \quad \tau_{U} = \frac{P_{U}}{2A}$$

$$P_{U} = 2A\tau_{U} = (2)(201.16 \times 10^{-6})(145 \times 10^{6}) = 58.336 \times 10^{3} \text{ N}$$

$$F.S. = \frac{P_{U}}{P} = \frac{58.336 \times 10^{3}}{20 \times 10^{3}}$$

$$F.S. = 2.92 \checkmark$$
(b) Tension in wood:

$$P_{U} = 58.336 \times 10^{3} \text{ N} \text{ for same F.S.}$$

$$\sigma_{U} = \frac{P_{U}}{A} = \frac{P_{U}}{w(b-d)} \text{ where } w = 40 \text{ mm} = 0.040 \text{ m}$$

$$b = d + \frac{P_{U}}{w\sigma_{U}} = 0.016 + \frac{58.336 \times 10^{3}}{(0.040)(60 \times 10^{6})} = 40.3 \times 10^{-3} \text{ m}$$

$$b = 40.3 \text{ mm} \checkmark$$
Shear in wood:

$$P_{U} = 58.336 \times 10^{3} \text{ N} \text{ for same F.S.}$$
Double shear: each area is $A = wc$

$$\tau_{U} = \frac{P_{U}}{2A} = \frac{P_{U}}{2wc}$$

$$c = \frac{P_{U}}{2w\tau_{U}} = \frac{58.336 \times 10^{3}}{(2)(0.040)(7.5 \times 10^{6})} = 97.2 \times 10^{-3} \text{ m}$$

$$c = 97.2 \text{ mm} \checkmark$$

PROBLEM 1.49

A steel plate $\frac{1}{4}$ in. thick is embedded in a concrete wall to anchor a high-strength cable as shown. The diameter of the hole in the plate is $\frac{3}{4}$ in., the ultimate strength of the steel used is 36 ksi, and the ultimate bonding stress between plate and concrete is 300 psi. Knowing that a factor of safety of 3.60 is desired when P = 2.5 kips, determine (*a*) the required width *a* of the plate, (*b*) the minimum depth *b* to which a plate of that width should be embedded in the concrete slab. (Neglect the normal stresses between the concrete and the end of the plate.)

SOLUTION Based on tension in plate,

$$P_U = \sigma_U A$$

$$P_U = \sigma_U A$$

$$F.S. = \frac{P_U}{P} = \frac{\sigma_U (a - d)}{P}$$

Solving for *a*,

$$a = d + \frac{(F.S.)P}{\sigma_U t} = \frac{3}{4} + \frac{(3.60)(2.5)}{(36)(\frac{1}{4})}$$

A = (a - d)t

(a) a = 1.750 in.

Based on shear between plate and concrete slab,

$$A = \text{perimeter} \times \text{depth} = 2(a + t)b \qquad \tau_U = 0.300 \text{ ksi}$$

$$P_U = \tau_U A = 2\tau_U (a + t)b \qquad F.S. = \frac{P_U}{P}$$
Solving for b,
$$b = \frac{(F.S.)P}{2(a + t)\tau_U} = \frac{(3.6)(2.5)}{(2)(1.75 + \frac{1}{4})(0.300)}$$
(b) $b = 7.50 \text{ in.} \blacktriangleleft$

Full file at https://TestbankDirect.eu/

PROBLEM 1.50

Determine the factor of safety for the cable anchor in Prob. 1.49 when P = 2.5 kips, knowing that a = 2 in. and b = 6 in.

PROBLEM 1.49 A steel plate $\frac{1}{4}$ in. thick is embedded in a concrete wall to anchor a highstrength cable as shown. The diameter of the hole in the plate is $\frac{3}{4}$ in., the ultimate strength of the steel used is 36 ksi, and the ultimate bonding stress between plate and concrete is 300 psi. Knowing that a factor of safety of 3.60 is desired when P = 2.5 kips, determine (*a*) the required width *a* of the plate, (*b*) the minimum depth *b* to which a plate of that width should be embedded in the concrete slab. (Neglect the normal stresses between the concrete and the end of the plate.)

F.S. = 3.24 <

SOLUTION

Based on tension in plate,

$$A = (a - d)t$$

= $\left(2 - \frac{3}{4}\right)\left(\frac{1}{4}\right) = 0.31250 \text{ in}^2$
= $(36)(0.31250) = 11.2500 \text{ kips}$
 $F.S. = \frac{P_U}{P} = \frac{11.2500}{3.5} = 4.50$

Based on shear between plate and concrete slab,

$$A = \text{perimeter} \times \text{depth} = 2(a + t)b = 2\left(2 + \frac{1}{4}\right)(6.0)$$

$$A = 27.0 \text{ in}^2 \qquad \tau_U = 0.300 \text{ ksi}$$

$$P_U = \tau_U A = (0.300)(27.0) = 8.10 \text{ kips}$$

$$F.S. = \frac{P_U}{P} = \frac{8.10}{2.5} = 3.240$$

Actual factor of safety is the smaller value.

PROBLEM 1.52

Solve Prob. 1.51, assuming that the structure has been redesigned to use $\frac{5}{16}$ -in-diameter pins at A and C as well as at B and that no other changes have been made.

PROBLEM 1.51 Link AC is made of a steel with a 65-ksi ultimate normal stress and has a $\frac{1}{4} \times \frac{1}{2}$ -in. uniform rectangular cross section. It is connected to a support at A and to member BCD at C by $\frac{3}{4}$ -in.-diameter pins, while member BCD is connected to its support at \vec{B} by a $\frac{5}{16}$ -in.diameter pin. All of the pins are made of a steel with a 25-ksi ultimate shearing stress and are in single shear. Knowing that a factor of safety of 3.25 is desired, determine the largest load **P** that can be applied at D. Note that link AC is not reinforced around the pin holes.

Solution
Use free body *BCD*.

$$+ M_{B} = 0: \quad (6) \left(\frac{8}{10}F_{AC}\right) - 10P = 0$$

$$P = 0.48F_{AC} \quad (1)$$

$$+ \Sigma F_{y} = 0: \quad B_{x} - \frac{6}{10}F_{AC} = 0$$

$$B_{x} = \frac{6}{10}F_{AC} = 1.25P \rightarrow$$

$$+ M_{C} = 0: \quad -6B_{y} - 4P = 0$$

$$B_{y} = -\frac{2}{3}P \quad \text{i.e.} \quad B_{y} = \frac{2}{3}P \downarrow$$

$$B = \sqrt{B_{x}^{2} + B_{y}^{2}} = \sqrt{1.25^{2} + \left(\frac{2}{3}\right)^{2}}P = 1.41667P \quad P = 0.70583B \quad (2)$$
Shear in pins at *A* and *C*.

$$F_{AC} = \tau A_{\text{pin}} = \frac{\tau_U}{F.S.} \frac{\pi}{4} d^2 = \left(\frac{25}{3.25}\right) \left(\frac{\pi}{4}\right) \left(\frac{5}{16}\right)^2 = 0.58999 \text{ kips}$$

Tension on net section of A and C.

$$F_{AC} = \sigma A_{\text{net}} = \frac{\sigma_U}{F.S.} A_{\text{net}} = \left(\frac{65}{3.25}\right) \left(\frac{1}{4}\right) \left(\frac{1}{2} - \frac{5}{16}\right) = 0.9375 \text{ kips}$$

Smaller value of F_{AC} is 0.58999 kips.

From (1),
$$P = (0.48)(0.58999) = 0.283$$
 kips
Shear in pin at B. $B = \tau A_{pin} = \frac{\tau_U}{F.S.} \frac{\pi}{4} d^2 = \left(\frac{25}{3.25}\right) \left(\frac{\pi}{4}\right) \left(\frac{5}{16}\right)^2 = 0.58999$ kips
From (2), $P = (0.70588)(0.58999) = 0.416$ kips
Allowable value of P is the smaller value. $P = 0.283$ kips or $P = 283$ lb

PROBLEM 1.53

Each of the two vertical links CF connecting the two horizontal members AD and EG has a 10 \times 40-mm uniform rectangular cross section and is made of a steel with an ultimate strength in tension of 400 MPa, while each of the pins at C and F has a 20-mm diameter and are made of a steel with an ultimate strength in shear of 150 MPa. Determine the overall factor of safety for the links CF and the pins connecting them to the horizontal members.

Full file at https://TestbankDirect.eu/

PROBLEM 1.54

Solve Prob. 1.53, assuming that the pins at C and F have been replaced by pins with a 30-mm diameter.

PROBLEM 1.53 Each of the two vertical links CF connecting the two horizontal members AD and EG has a 10×40 -mm uniform rectangular cross section and is made of a steel with an ultimate strength in tension of 400 MPa, while each of the pins at C and F has a 20-mm diameter and are made of a steel with an ultimate strength in shear of 150 MPa. Determine the overall factor of safety for the links CF and the pins connecting them to the horizontal members.

SOLUTION

Use member *EFG* as free body.

+)
$$\Sigma M_E = 0$$
: 0.40 $F_{CF} - (0.65)(24 \times 10^3) = 0$
 $F_{CF} = 39 \times 10^3 \text{ N}$

Based on tension in links CF,

$$A = (b - d)t = (0.040 - 0.030)(0.010) = 100 \times 10^{-6} \text{ m}^2 \quad \text{(one link)}$$
$$F_U = 2\sigma_U A = (2)(400 \times 10^6)(100 \times 10^{-6}) = 80.0 \times 10^3 \text{ N}$$

Based on double shear in pins,

$$A = \frac{\pi}{4}d^2 = \frac{\pi}{4}(0.030)^2 = 706.86 \times 10^{-6} \text{ m}^2$$

$$F_U = 2\tau_U A = (2)(150 \times 10^6)(706.86 \times 10^{-6}) = 212.06 \times 10^3 \text{ N}$$

Actual F_U is smaller value, i.e. $F_U = 80.0 \times 10^3 \text{ N}$

Factor of

of safety:
$$F.S. = \frac{F_U}{F_{CF}} = \frac{80.0 \times 10^3}{39 \times 10^3}$$
 $F.S. = 2.05 \blacktriangleleft$

PROPRIETARY MATERIAL. Copyright © 2015 McGraw-Hill Education. This is proprietary material solely for authorized instructor use. Not authorized for sale or distribution in any manner. This document may not be copied, scanned, duplicated, forwarded, distributed, or posted on a website, in whole or part.

Full file at https://TestbankDirect.eu/

PROBLEM 1.55

In the structure shown, an 8-mm-diameter pin is used at A, and 12-mm-diameter pins are used at B and D. Knowing that the ultimate shearing stress is 100 MPa at all connections and that the ultimate normal stress is 250 MPa in each of the two links joining B and D, determine the allowable load **P** if an overall factor of safety of 3.0 is desired.

SOLUTION

Full file at https://TestbankDirect.eu/

PROBLEM 1.56

In an alternative design for the structure of Prob. 1.55, a pin of 10-mm-diameter is to be used at A. Assuming that all other specifications remain unchanged, determine the allowable load **P** if an overall factor of safety of 3.0 is desired.

PROBLEM 1.55 In the structure shown, an 8mm-diameter pin is used at A, and 12-mmdiameter pins are used at B and D. Knowing that the ultimate shearing stress is 100 MPa at all connections and that the ultimate normal stress is 250 MPa in each of the two links joining B and D, determine the allowable load P if an overall factor of safety of 3.0 is desired.

-0.20---0.

SOLUTION

Statics: Use *ABC* as free body.

$$+ \sum M_{B} = 0: \quad 0.20F_{A} - 0.18P = 0 \qquad P = \frac{10}{9}F_{A}$$

+
$$\sum M_{A} = 0: \quad 0.20F_{BD} - 0.38P = 0 \qquad P = \frac{10}{19}F_{BD}$$

Based on double shear in pin A, $A = \frac{\pi}{4}d^2 = \frac{\pi}{4}(0.010)^2 = 78.54 \times 10^{-6} \text{ m}^2$

$$F_A = \frac{2\tau_U A}{F.S.} = \frac{(2)(100 \times 10^6)(78.54 \times 10^{-6})}{3.0} = 5.236 \times 10^3 \text{ N}$$
$$P = \frac{10}{9}F_A = 5.82 \times 10^3 \text{ N}$$

Based on double shear in pins at *B* and *D*, $A = \frac{\pi}{4}d^2 = \frac{\pi}{4}(0.012)^2 = 113.10 \times 10^{-6} \text{ m}^2$

$$F_{BD} = \frac{2\tau_U A}{F.S.} = \frac{(2)(100 \times 10^6)(113.10 \times 10^{-6})}{3.0} = 7.54 \times 10^3 \,\mathrm{N}$$
$$P = \frac{10}{19} F_{BD} = 3.97 \times 10^3 \,\mathrm{N}$$

Based on compression in links *BD*, for one link, $A = (0.020)(0.008) = 160 \times 10^{-6} \text{ m}^2$

$$F_{BD} = \frac{2\sigma_U A}{F.S.} = \frac{(2)(250 \times 10^6)(160 \times 10^{-6})}{3.0} = 26.7 \times 10^3 \text{ N}$$
$$P = \frac{10}{19} F_{BD} = 14.04 \times 10^3 \text{ N}$$

Allowable value of P is smallest, $\therefore P = 3.97 \times 10^3 \text{ N}$

PROBLEM 1.57

A 40-kg platform is attached to the end *B* of a 50-kg wooden beam *AB*, which is supported as shown by a pin at *A* and by a slender steel rod *BC* with a 12-kN ultimate load. (*a*) Using the Load and Resistance Factor Design method with a resistance factor $\phi = 0.90$ and load factors $\gamma_D = 1.25$ and $\gamma_L = 1.6$, determine the largest load that can be safely placed on the platform. (*b*) What is the corresponding conventional factor of safety for rod *BC*?

Full file at https://TestbankDirect.eu/

PROBLEM 1.58

The Load and Resistance Factor Design method is to be used to select the two cables that will raise and lower a platform supporting two window washers. The platform weighs 160 lb and each of the window washers is assumed to weigh 195 lb with equipment. Since these workers are free to move on the platform, 75% of their total weight and the weight of their equipment will be used as the design live load of each cable. (*a*) Assuming a resistance factor $\phi = 0.85$ and load factors $\gamma_D = 1.2$ and $\gamma_L = 1.5$, determine the required minimum ultimate load of one cable. (*b*) What is the corresponding conventional factor of safety for the selected cables?

PROBLEM 1.61

For the assembly and loading of Prob. 1.60, determine (*a*) the average shearing stress in the pin at C, (*b*) the average bearing stress at C in member BC, (*c*) the average bearing stress at B in member BC.

PROBLEM 1.60 Two horizontal 5-kip forces are applied to pin B of the assembly shown. Knowing that a pin of 0.8-in. diameter is used at each connection, determine the maximum value of the average normal stress (*a*) in link AB, (*b*) in link BC.

PROBLEM 1.62

Two steel plates are to be held together by means of 16-mmdiameter high-strength steel bolts fitting snugly inside cylindrical brass spacers. Knowing that the average normal stress must not exceed 200 MPa in the bolts and 130 MPa in the spacers, determine the outer diameter of the spacers that yields the most economical and safe design.

SOLUTION

At each bolt location the upper plate is pulled down by the tensile force P_b of the bolt. At the same time, the spacer pushes that plate upward with a compressive force P_s in order to maintain equilibrium.

or $P_b = \frac{\pi}{4} \sigma_b d_b^2$

 $P_b = P_s$

For the bolt, $\sigma_b = \frac{F_b}{A_b} = \frac{4P_b}{\pi d_b^2}$

For the spacer,	$\sigma_s = \frac{P_s}{A_s} = \frac{4P_s}{\pi(d^2 - d_s^2)}$	or	$P_s = \frac{\pi}{4}\sigma_s(d_s^2 - d_b^2)$
	$A_s = \pi(a_s - a_b)$		4

Equating P_b and P_s ,

$$\frac{\pi}{4}\sigma_b d_b^2 = \frac{\pi}{4}\sigma_s (d_s^2 - d_b^2)$$
$$d_s = \sqrt{\left(1 + \frac{\sigma_b}{\sigma_s}\right)} d_b = \sqrt{\left(1 + \frac{200}{130}\right)} (16) \qquad d_s = 25.2 \text{ mm} \blacktriangleleft$$

Full file at https://TestbankDirect.eu/

PROBLEM 1.63

A couple **M** of magnitude 1500 N \cdot m is applied to the crank of an engine. For the position shown, determine (*a*) the force **P** required to hold the engine system in equilibrium, (*b*) the average normal stress in the connecting rod *BC*, which has a 450-mm² uniform cross section.

Use piston, rod, and crank together as free body. Add wall reaction H and bearing reactions A_x and A_y .

+)
$$\Sigma M_A = 0$$
: (0.280 m) $H - 1500$ N · m = 0
 $H = 5.3571 \times 10^3$ N

Use piston alone as free body. Note that rod is a two-force member; hence the direction of force F_{BC} is known. Draw the force triangle and solve for *P* and F_{BE} by proportions.

$$l = \sqrt{200^2 + 60^2} = 208.81 \text{ mm}$$

 $\frac{P}{H} = \frac{200}{60}$ \therefore $P = 17.86 \times 10^3 \text{ N}$
(a) $P = 17.86 \text{ kN}$

$$\frac{F_{BC}}{H} = \frac{208.81}{60} \quad \therefore \quad F_{BC} = 18.6436 \times 10^3 \,\mathrm{N}$$

Rod BC is a compression member. Its area is

$$450 \text{ mm}^2 = 450 \times 10^{-6} \text{ m}^2$$

Stress:

$$\sigma_{BC} = \frac{-F_{BC}}{A} = \frac{-18.6436 \times 10^3}{450 \times 10^{-6}} = -41.430 \times 10^6 \,\mathrm{Pa}$$
(b) $\sigma_{BC} = -41.4 \,\mathrm{MPa}$

PROBLEM 1.65

A $\frac{5}{8}$ -in.-diameter steel rod *AB* is fitted to a round hole near end *C* of the wooden member *CD*. For the loading shown, determine (*a*) the maximum average normal stress in the wood, (*b*) the distance *b* for which the average shearing stress is 100 psi on the surfaces indicated by the dashed lines, (*c*) the average bearing stress on the wood.

SOLUTION

(a) <u>Maximum normal stress in the wood</u>.

$$A_{\text{net}} = (1)\left(4 - \frac{5}{8}\right) = 3.375 \text{ in}^2$$

 $\sigma = \frac{P}{A_{\text{net}}} = \frac{1500}{3.375} = 444 \text{ psi}$ $\sigma = 444 \text{ psi}$

(b) Distance b for $\tau = 100 \text{ psi}$.

For sheared area see dotted lines.

$$\tau = \frac{P}{A} = \frac{P}{2bt}$$

$$b = \frac{P}{2t\tau} = \frac{1500}{(2)(1)(100)} = 7.50 \text{ in.} \qquad b = 7.50 \text{ in.} \blacktriangleleft$$

(c) Average bearing stress on the wood.

$$\sigma_b = \frac{P}{A_b} = \frac{P}{dt} = \frac{1500}{\left(\frac{5}{8}\right)(1)} = 2400 \text{ psi} \qquad \sigma_b = 2400 \text{ psi} \blacktriangleleft$$

PROP<u>RIETARY MATERIAL</u>. Copyright © 2015 McGraw-Hill Education. This is proprietary material solely for authorized instructor use. Not authorized for sale or distribution in any manner. Full file at https://TestbankDirect.eu/

PROBLEM 1.66

In the steel structure shown, a 6-mmdiameter pin is used at C and 10-mmdiameter pins are used at B and D. The ultimate shearing stress is 150 MPa at all connections, and the ultimate normal stress is 400 MPa in link BD. Knowing that a factor of safety of 3.0 is desired, determine the largest load P that can be applied at A. Note that link BD is not reinforced around the pin holes.

SOLUTION

Use free body *ABC*.

$$F_{BD} + \Sigma M_{C} = 0: 0.280P - 0.120F_{BD} = 0$$

$$P = \frac{3}{7}F_{BD} \qquad (1)$$

$$+ \Sigma M_{B} = 0: 0.160P - 0.120C = 0$$

$$P = \frac{3}{4}C \qquad (2)$$

Tension on net section of link BD:

$$F_{BD} = \sigma A_{\text{net}} = \frac{\sigma_U}{F.S.} A_{\text{net}} = \left(\frac{400 \times 10^6}{3}\right) (6 \times 10^{-3})(18 - 10)(10^{-3}) = 6.40 \times 10^3 \text{ N}$$

Shear in pins at *B* and *D*:

$$F_{BD} = \tau A_{\text{pin}} = \frac{\tau_U}{F.S.} \frac{\pi}{4} d^2 = \left(\frac{150 \times 10^6}{3}\right) \left(\frac{\pi}{4}\right) (10 \times 10^{-3})^2 = 3.9270 \times 10^3 \,\text{N}$$

Smaller value of F_{BD} is 3.9270×10^3 N.

From (1),
$$P = \left(\frac{3}{7}\right)(3.9270 \times 10^3) = 1.683 \times 10^3 \text{ N}$$

Shear in pin at C:

Shear in pin at C:
$$C = 2\tau A_{\text{pin}} = 2\frac{\tau_U}{F.S.}\frac{\pi}{4}d^2 = (2)\left(\frac{150 \times 10^6}{3}\right)\left(\frac{\pi}{4}\right)(6 \times 10^{-3})^2 = 2.8274 \times 10^3 \text{ N}$$

From (2), $P = \left(\frac{3}{4}\right)(2.8274 \times 10^3) = 2.12 \times 10^3 \text{ N}$
Smaller value of P is allowable value. $P = 1.683 \times 10^3 \text{ N}$ $P = 1.683 \text{ kN} \blacktriangleleft$

From (2),

 $A = \pi dL$

 $\tau_{\rm all}\pi dL = \sigma_{\rm all}\frac{\pi}{4}d^2$

 $P = \tau_{\rm all} A = \tau_{\rm all} \pi dL$

Full file at https://TestbankDirect.eu/

PROBLEM 1.68

A force **P** is applied as shown to a steel reinforcing bar that has been embedded in a block of concrete. Determine the smallest length *L* for which the full allowable normal stress in the bar can be developed. Express the result in terms of the diameter *d* of the bar, the allowable normal stress σ_{all} in the steel, and the average allowable bond stress τ_{all} between the concrete and the cylindrical surface of the bar. (Neglect the normal stresses between the concrete and the end of the bar.)

> ZA ALLER P

> > $L_{\min} = \sigma_{\text{all}} d/4 \tau_{\text{all}} \blacktriangleleft$

SOLUTION

For shear,

For tension, $A = \frac{\pi}{4}d^2$ $P = \sigma_{\text{all}}A = \sigma_{\text{all}}\left(\frac{\pi}{4}d^2\right)$

Equating,

Solving for *L*,

Full file at https://TestbankDirect.eu/

PROBLEM 1.69

The two portions of member AB are glued together along a plane forming an angle θ with the horizontal. Knowing that the ultimate stress for the glued joint is 2.5 ksi in tension and 1.3 ksi in shear, determine (*a*) the value of θ for which the factor of safety of the member is maximum, (*b*) the corresponding value of the factor of safety. (*Hint:* Equate the expressions obtained for the factors of safety with respect to the normal and shearing stresses.)

SOLUTION		
$A_0 = (2.0)(1.25) = 2.50 \text{ in}^2$		
At the optimum angle, $(F.S.)_{\sigma} = (F.S.)_{\tau}$		
Normal stress: $\sigma = \frac{P}{A_0} \cos^2 \theta$ \therefore $P_{U,\sigma} = \frac{\sigma_U A_0}{\cos^2 \theta}$		
$(F.S.)_{\sigma} = \frac{P_{U,\sigma}}{P} = \frac{\sigma_U A_0}{P \cos^2 \theta}$		
Shearing stress: $\tau = \frac{P}{A_0} \sin \theta \cos \theta$ \therefore $P_{U,\tau} = \frac{\tau_U A_0}{\sin \theta \cos \theta}$		
$(F.S.)_{\tau} = \frac{P_{U,\tau}}{P} = \frac{\tau_U A_0}{P \sin \theta \cos \theta}$		
Equating, $\frac{\sigma_U A_0}{P \cos^2 \theta} = \frac{\tau_U A_0}{P \sin \theta \cos \theta}$		
Solving, $\frac{\sin\theta}{\cos\theta} = \tan\theta = \frac{\tau_U}{\sigma_U} = \frac{1.3}{2.5} = 0.520$	(<i>a</i>)	$\theta_{\rm opt} = 27.5^{\circ}$
(b) $P_U = \frac{\sigma_U A_0}{\cos^2 \theta} = \frac{(12.5)(2.50)}{\cos^2 27.5^\circ} = 7.94 \text{ kips}$		
$F.S. = \frac{P_U}{P} = \frac{7.94}{2.4}$		<i>F.S.</i> = 3.31

PROP<u>RIETARY MATERIAL.</u> Copyright © 2015 McGraw-Hill Education. This is proprietary material solely for authorized instructor use. Not authorized for sale or distribution in any manner. Full file at https://TestbankDirect.eu/

PROBLEM 1.70

The two portions of member *AB* are glued together along a plane forming an angle θ with the horizontal. Knowing that the ultimate stress for the glued joint is 2.5 ksi in tension and 1.3 ksi in shear, determine the range of values of θ for which the factor of safety of the members is at least 3.0.

SOLUTION	
$A_0 = (2.0)(1.25) = 2.50 \text{ in.}^2$	
P = 2.4 kips	
$P_U = (F.S.)P = 7.2$ kips	
Based on tensile stress,	
$\sigma_U = \frac{P_U}{A_0} \cos^2 \theta$	
$\cos^2 \theta = \frac{\sigma_U A_0}{P_U} = \frac{(2.5)(2.50)}{7.2} = 0.86806$	
$\cos\theta = 0.93169$ $\theta = 21.3^{\circ}$ $\theta > 21.3^{\circ}$	
Based on shearing stress, $\tau_U = \frac{P_U}{A_0} \sin \theta \cos \theta = \frac{P_U}{2A_0} \sin 2\theta$	
$\sin 2\theta = \frac{2A_0\tau_U}{P_U} = \frac{(2)(2.50)(1.3)}{7.2} = 0.90278$	
$2\theta = 64.52^{\circ}$ $\theta = 32.3^{\circ}$ $\theta < 32.3^{\circ}$	
Hence,	$21.3^\circ < \theta < 32.3^\circ \blacktriangleleft$

Full file at https://TestbankDirect.eu/

PROBLEM 1.C1

A solid steel rod consisting of *n* cylindrical elements welded together is subjected to the loading shown. The diameter of element *i* is denoted by d_i and the load applied to its lower end by \mathbf{P}_i with the magnitude P_i of this load being assumed positive if \mathbf{P}_i is directed downward as shown and negative otherwise. (*a*) Write a computer program that can be used with either SI or U.S. customary units to determine the average stress in each element of the rod. (*b*) Use this program to solve Problems 1.1 and 1.3.

SOLUTION

Force in element i:

It is the sum of the forces applied to that element and all lower ones:

$$F_i = \sum_{k=1}^i P_k$$

Average stress in element i:

Area =
$$A_i = \frac{1}{4}\pi d_i^2$$

Ave. stress = $\frac{F_i}{A_i}$

Program outputs:

Pre	oblem 1.1	Pro	blem 1.3
Element	Stress (MPa)	Element	Stress (ksi)
1	84.883	1	22.635
2	-96.766	2	17.927

PROBLEM 1.C2

A 20-kN load is applied as shown to the horizontal member ABC. Member ABC has a 10×50 -mm uniform rectangular cross section and is supported by four vertical links, each of 8×36-mm uniform rectangular cross section. Each of the four pins at A, B, C, and D has the same diameter d and is in double shear. (a) Write a computer program to calculate for values of d from 10 to 30 mm, using 1-mm increments, (i) the maximum value of the average normal stress in the links connecting pins B and D, (ii) the average normal stress in the links connecting pins C and E, (iii) the average shearing stress in pin B, (iv) the average shearing stress in pin C, (v) the average bearing stress at B in member ABC, and (vi) the average bearing stress at C in member ABC. (b) Check your program by comparing the values obtained for d = 16 mm with the answers given for Probs. 1.7 and 1.27. (c) Use this program to find the permissible values of the diameter d of the pins, knowing that the allowable values of the normal, shearing, and bearing stresses for the steel used are, respectively, 150 MPa, 90 MPa, and 230 MPa. (d) Solve Part c, assuming that the thickness of member ABC has been reduced from 10 to 8 mm.

SOLUTION	$P = 20 \text{ kN} \qquad 2F \text{ A } \text{ A}$
<u>Forces in links</u> . <i>F.B.</i> diagram of <i>ABC</i> : +) $\Sigma M_C = 0$: $2F_{BD}$	(BC) - P(AC) = 0
$F_{BD} = P(AC)/2((+)\Sigma M_B = 0) = 2F_{CE}$	$BC) (\text{tension}) \qquad \forall 2 F_{BD}$ $(BC) - P(AB) = 0$
(i) <u>Link BD</u> . Thickness = t_L $A_{BD} = t_L(w_L - d)$ $\sigma_{BD} = +F_{BD}/A_{BD}$ $F_{CE} = P(AB)/2($	BC) (comp.) (ii) <u>Link CE</u> . Thickness = t_L $A_{CE} = t_L w_L$ $\sigma_{CE} = -F_{CE}/A_{CE}$
(iii) <u>Pin B</u> . $\mathcal{W}_{\mathcal{L}}$	(iv) <u>Pin C</u> .
(v) $\begin{aligned} \tau_B &= F_{BD} / (\pi d^2/4) \\ \text{(v)} \underline{\text{Bearing stress at } B}. \\ \text{Thickness of member } AC &= t_{AC} \end{aligned}$	$\tau_{C} = F_{CE} / (\pi d^{2}/4)$ Shearing stress in <i>ABC</i> under Pin <i>B</i> . $F_{B} = \tau_{AC} t_{AC} (w_{AC}/2)$ $\Sigma F_{B} = 0; 2F_{B} = 2F_{AC}$
Sig Bear $B = F_{BD}/(dt_{AC})$ (vi) <u>Bearing stress at C</u> . Sig Bear $C = F_{CE}/(dt_{AC})$	$\tau_{AC} = \frac{2F_{BD}}{\tau_{AC}w_{AC}}$

PROBLEM 1.C3

Two horizontal 5-kip forces are applied to Pin B of the assembly shown. Each of the three pins at A, B, and C has the same diameter dand is double shear. (a) Write a computer program to calculate for values of d from 0.50 to 1.50 in., using 0.05-in. increments, (i) the maximum value of the average normal stress in member AB, (ii) the average normal stress in member BC, (iii) the average shearing stress in pin A, (iv) the average shearing stress in pin C, (v) the average bearing stress at A in member AB, (vi) the average bearing stress at C in member BC, and (vii) the average bearing stress at B in member BC. (b) Check your program by comparing the values obtained for d = 0.8 in. with the answers given for Problems 1.60 and 1.61. (c) Use this program to find the permissible values of the diameter d of the pins, knowing that the allowable values of the normal, shearing, and bearing stresses for the steel used are, respectively, 22 ksi, 13 ksi, and 36 ksi. (d) Solve Part c_{1} , assuming that a new design is being investigated in which the thickness and width of the two members are changed, respectively, from 0.5 to 0.3 in. and from 1.8 to 2.4 in.

PROBLEM 1.C4

A 4-kip force **P** forming an angle α with the vertical is applied as shown to member *ABC*, which is supported by a pin and bracket at *C* and by a cable *BD* forming an angle β with the horizontal. (*a*) Knowing that the ultimate load of the cable is 25 kips, write a computer program to construct a table of the values of the factor of safety of the cable for values of α and β from 0 to 45°, using increments in α and β corresponding to 0.1 increments in tan α and tan β . (*b*) Check that for any given value of α , the maximum value of the factor of safety is obtained for $\beta = 38.66^{\circ}$ and explain why. (*c*) Determine the smallest possible value of α , and explain the result obtained.

SOLUTION

Full file at https://TestbankDirect.eu/

PROBLEM 1.C5

A load **P** is supported as shown by two wooden members of uniform rectangular cross section that are joined by a simple glued scarf splice. (*a*) Denoting by σ_U and τ_U , respectively, the ultimate strength of the joint in tension and in shear, write a computer program which, for given values of *a*, *b*, *P*, σ_U and τ_U , expressed in either SI or U.S. customary units, and for values of α from 5 to 85° at 5° intervals, can be used to calculate (i) the normal stress in the joint, (ii) the shearing stress in the joint, (iii) the factor of safety relative to failure in tension, (iv) the factor of safety relative to failure in shear, and (v) the overall factor of safety for the glued joint. (*b*) Apply this program, using the dimensions and loading of the members of Probs. 1.29 and 1.31, knowing that $\sigma_U = 1.50$ MPa for the glue used in Prob. 1.31. (*c*) Verify in each of these two cases that the shearing stress is maximum for $a = 45^\circ$.

SOLUTION

(i) and (ii) Draw the *F*.*B*. diagram of lower member:

Area = $ab/\sin \alpha$

Normal stress:

$$\sigma = \frac{F}{\text{Area}} = (P/ab)\sin^2\alpha$$

 $\tau = \frac{V}{A rea} = (P/ab) \sin \alpha \cos \alpha$

Shearing stress:

(iii) F.S. for tension (normal stresses):

$$FSN = \sigma_U / \sigma$$

(iv) F.S. for shear:

 $FSS = \tau_U / \tau$

(v) Overall F.S.:

F.S. = The <u>smaller</u> of *FSN* and *FSS*.

PROBLEM 1.C6

Member ABC is supported by a pin and bracket at A and by two links, which are pinconnected to the member at B and to a fixed support at D. (a) Write a computer program to calculate the allowable load $P_{\rm all}$ for any given values of (i) the diameter d_1 of the pin at A, (ii) the common diameter d_2 of the pins at B and D, (iii) the ultimate normal stress σ_U in each of the two links, (iv) the ultimate shearing stress τ_{II} in each of the three pins, and (v) the desired overall factor of safety F.S. (b) Your program should also indicate which of the following three stresses is critical: the normal stress in the links, the shearing stress in the pin at A, or the shearing stress in the pins at B and D. (c) Check your program by using the data of Probs. 1.55 and 1.56, respectively, and comparing the answers obtained for $P_{\rm all}$ with those given in the text. (d) Use your program to determine the allowable load P_{all} , as well as which of the stresses is critical, when $d_1 =$ $d_2 = 15 \text{ mm}, \sigma_U = 110 \text{ MPa}$ for aluminum links, $\tau_U = 100$ MPa for steel pins, and *F.S.* = 3.2.
